**(54) PACKAGING BAG FOR  
HEAT TREATMENT**

(57) Abstract:

**PROBLEM TO BE SOLVED:** To open a bag at a preminarily prepared position and prevent a packaged body from breaking, by providing a swelling seal partly expanded or a partly lacking non-seal part at a part of a seal part of a packaging bag as an easily steam-permeable means.

**SOLUTION:** An easily steam-permeable means 3 is provided at one or more positions of a seal part 2 in a bag that a square plastic film 1 is superposed and the three sides thereof are heat-sealed by a specified width, for instance. The easily steam-permeable means 3 is constituted of a non-seal part 4 and a swelling seal part 5. The non-seal part 4 is formed from the external edge and the seal width is made partly narrow and the swelling seal part 5 is partly swelled from the inside edge of the non-seal part 4 toward the inside. Or the seal part is partly cut and non-seal part is provided

in a case. The packaging bag A expands with heat and pressure and the swelling seal part 5 most easily affected by a peeling stress is gradually peeled off and opened to prevent the packaging bag A from breaking.
